

Input / Output

Done

To do

Input:
string json

```
"[{... "***", ... "***"}  
  {r-id: "***", v-id: "***"}  
  ... ]"
```

get vector of
paths of rdfs to test

```
[~/...../latest/rdf.yaml,  
~/...../5888237/rdf.yaml,  
... ]
```

parse each rdf path
into a model to test
(keep relevant fields)

```
[{:weights :sample_input ...}  
 {}  
 ... ]
```

Filter obvious "failed" models
(avoid downloads)

generate corresponding
folders for test summaries

Output:
Deploy to gh pages branch

write test summaries

Set up Fiji
Set up DeepimageJ

- Create a folder for every model
- Download files for testing
- Build deepimagej arguments

TEST WITH DEEPIIMAGEJ HEADLESS

Compare with expected output
